One step real-time RT-PCR Kit

Catalog No. PG-30017

Quantity: 50 reactions

Reaction volume: 25 μ l/reaction

Application

For quantitative, one step real-time RTPCR using sequence-specific probes. The one step real-time RTPCR Kit provides accurate real-time quantification of RNA targets in an easy-to-handle format. The ROX fluorescent dye included in the master mix serves as an internal reference for normalization of the fluorescent signal when carrying out reactions using the ABI Sequence Detection Systems.

Kit Components

1. Real-time RTPCR Master Mix, 2.5x

2. Real-time RTPCR Enzyme Mix, 50x

(Including Reverse Transcriptase and Hot Start DNA Polymerase)

3. dNTP Mix, 10 mM each

4. Nuclease-free water

Storage

Store at -20°C.

Related Products

Real-time PCR kit (PG- 30009).

Table 1. Reaction components for One step real-time RTPCR

Component	Volume/reaction	Final concentration
PCR Mix:		
Nuclease-free water (provided)	Variable	-
2.5x Real-time RTPCR Master Mix	10 μ l	1x
50x Real-time RTPCR Enzyme Mix	0.5 μ l	1x
dNTP Mix, 10 mM each	0.5 μ l	200 μ M
Forward primer	Variable	300 nM
Reverse primer	Variable	300 nM
Probe	Variable	100~200 nM
RNase inhibitor (optional)	Variable	5-10 units
Template RNA	Variable	-

Table 2. Thermal cycler conditions:

			Additional comments
Reverse transcription:	30 min	50°C	A reverse-transcription reaction temperature of 50°C is recommended. However, if satisfactory results are not obtained using 50°C, the reaction temperature may be increased up to 60°C
Initial PCR activation step:	3min	95°C	
2-step cycling:			
Denaturation:	15 sec	94°C	Hot Start DNA Polymerase is activated by this heating step.
Annealing/ Extension:	1 min	60°C	
Number of cycles:	40		The cycle number is dependent on the amount of template RNA

FOR RESEARCH USE ONLY AND NOT INTENDED FOR DIAGNOSTIC OR THERAPEUTIC USE
