Serum free medium for BHK cell culture (B-SFM)

Catalog No. PG-40022

Quantity: 100 L working solution

Storage: 4°C ~ -20°C

Description

In the light of the growing worldwide shortage and consequent price instability associated with fetal bovine serum, the development of effective serum-free media formulations has become essential for the future growth of the biotechnology industries. In addition, the use of fetal bovine serum requires prior sampling of each lot, and leads to batch variations as well as purification difficulties in production. We have developed serum-free medium for BHK cell culture (B-SFM).

Components

Part A : 2 × 50 L dry basal medium

The powder part, which is convenient for transportation and storage. The powder part can also be replaced by 199 medium in use.

Part B : 500 mL serum substitute

Liquid pre-dissolved part (supplied in sterile liquid form), which is to be added to **Part A** proportionally when used, no sterilization is required, so it's convenient to use.

It's not necessary to change your existing production process with our B-SFM medium.

Advantages

1. In the cell adherence and proliferation stages, **B-SFM can reduce or substitute the use of bovine serum.**
2. In the cell maintenance stage after virus inoculation, B-SFM can substitute the amount of use of human serum albumin as a cell protector, or even replace the use of human serum albumin completely. In addition, **the yield of virus can be higher or at least equivalent to that of conventional production process.**

FOR RESEARCH USE ONLY AND NOT INTENDED FOR DIAGNOSTIC OR THERAPEUTIC USE
